Please write a short summary of your Capstone project and its components. Describe the problem statement, your approaches, and your conclusions. (200-400 words)

Problem: The main objective is to create a recommendation system to recommend relevant books to users based on popularity and user interests

Approach: First Handel all null values. Remove irrelevant columns. Remove anomaly. use feature engineering to get scores for books.

Conclusions / Recommendations:
- The result from Collaborative filtering are decent

Future challenges:
- We need to build a more complex model for the recommender system to improve the accuracy
- The model should account age, location and we can ask the user for interest in the genre to further narrow down the results
